Joutensuon tuuli- ja aurinkovoimahanke

1 JOHDANTO MELU- JA VÄLKEMALLINNUKSIIN

Joutensuon tuuli- ja aurinkovoimahankkeen hankeomistaja VSB Uusiutuva Energia Suomi Oy suunnittelee 46 tuulivoimalan rakentamista hankevaihtoehdossa 1 (VE 1) ja 32 voimalan rakentamista hankevaihtoehdossa 2 (VE 2) Pudasjärvelle. Tämä melu- ja välkemallinnusraportti on laadittu Joutensuon tuuli- ja aurinkovoimahankkeen ympäristövaikutusten arviointinnettelyn mukaisten sijoitussuunnitelmien perusteella.

Tuulivoimaloiden aiheuttamia meluvaikutuksia on arvioitu WindPRO-ohjelman DECIBEL-moduulilla. Tuulivoimaloiden aiheuttamat välkevaikutukset on mallinnettu WindPro-ohjelman SHADOW-moduulilla. Melu- ja välkemallinnukset on laatinut Aarni Nikkola ja laaduntarkastuksen on tehnyt Johanna Harju FCG Rakennettu Ympäristö Oy:stä.

2 LÄHTÖTIEDOT JA MENETELMÄT

2.1 Melu

2.1.1 Melumallinnus ISO 9613-2:2024

Tuulivoimaloiden aiheuttamat A-painotetut äänitasot mallinnettiin WindPRO-laskentaohjelman Decibel-moduulilla ISO 9613-2:2024 standardin mukaisesti. Ympäristöhallinnon tuulivoimaloiden melun mallintamista koskevan ohjeen 2/2014 mukaisesti tuulen nopeutena käytettiin 10 m korkeudella mitattuna 8 m/s, ilman lämpötilana 15 °C, ilmanpaineena 101,325 kPa, ilman suhteellisena kosteutena 70 % ja maanpinnan kovuutena arvoa 0,4. Laskenta on tehty 4,0 m maan pinnan tasosta. Käytetyt mallinnusparametrit on esitetty taulukossa 4.

Joutensuon tuulivoimaloiden tuottamat äänenpainetasot on mallinnettu käyttäen voimalaitoksesta Nordex N175/6.X johdettua geneeristä voimalatyyppiä, jonka napakorkeus on 200 metriä ja roottorin halkaisija 220 metriä. Voimaloiden kokonaiskorkeus on näin ollen 310 metriä ja teho enimmillään 6,8 MW. Joutensuon kaikissa melumallinnuksissa on lisäksi huomioitu Tolpanvaaran tuulivoima-alueen rakennusluvalliset tuulivoimalat (22 kpl). Tolpanvaaran rakennusluvallisista voimaloista 13 kpl on rakennettu ja yhdeksää voimalaa ei toistaiseksi ole rakennettu. Tolpanvaaran tuulivoimaloiden äänenpainetasot on mallinnettu käyttäen voimalaitosta Nordex N163/5.X, jonka napakorkeus on 148,5 metriä ja roottorin halkaisija 163 metriä. Tolpanvaaran voimaloiden kokonaiskorkeus on näin ollen 230 metriä.

Joutensuon voimaloiden tuottaman äänen lähtöarvoina käytettiin voimalaitosvalmistajan voimalamallin asiakirjasta löytyviä äänitehotasoja (= melupäästö). Asiakirjan mukaan

11.3.2026

voimalaitoksen Nordex N175/6.X lähtömelutaso on 106,9 dB(A), kun käytetään ääntä vai-mentavaa siipityyppiä (serrated trailing edge). Lähtömelutasoon lisättiin 2,0 dB:n varmuus-arvo. Varmuusarvo 2,0 dB lisätään ympäristöministeriön ohjeistuksen (YM9/5511/2016) mu-kaan, jos standardin IEC 61400-14 mukaista takuuarvoa ei ole käytettävissä. Voimalaitosval-mistajan asiakirjan äänitehotasot sekä tiedot mallinnusohjelmasta on esitetty taulukossa 1.

Melumallinnuksista on laadittu lisäksi nykytilan mallinnukset sekä muiden lähialueen hank-keiden kanssa muodostuvat melun yhteisvaikutuksen mallinnukset. Nykytilan mallinnuksissa on huomioitu Tolpanvaaran hankkeen rakennusluvalliset tuulivoimalat (22 kpl). Yhteisvaiku-tusmallinnuksissa on huomioitu Joutensuon suunniteltujen tuulivoimaloiden ja Tolpanvaaran rakennusluvallisten voimaloiden lisäksi Tolpanvaaran laajennuksen (24 voimalaa) tuulivoima-hanke. Tolpanvaaran ja Tolpanvaaran laajennuksen tuulivoimaloiden tiedot on esitetty tau-lukoissa 2 ja 3.

Melumallinnusten laskentatuloksia on havainnollistettu ns. keskiäänitasokarttojen avulla. Keskiäänitasokartoissa on melun keskiäänitaso- eli ekvivalenttiäänitasokäyrät (L_{Aeq}) 5 dB:n välein.

2.1.2 Pienitaajuinen melu

Pienitaajuinen melu laskettiin Ympäristöministeriön ohjeen 2/2014 mukaisin menetelmin käyttäen voimalavalmistajan asiakirjan äänitehotasoja. Laskennan lähtökohta on standardi ISO 9613-2, jossa huomioidaan äänen geometrinen etäisyysvaimennus sekä maanpinnan ja ilmakehän absorption aiheuttamat vakioidut vahvistukset ja vaimennukset. Tulokset esitetään taajuuskohtaisena taulukkona hankealueen lähistöltä valituille asuin- ja lomarakennuksille.

Ohje 2/2014 antaa menetelmän pienitaajuisen melun laskentaan rakennusten ulkopuolelle. Sosiaali- ja terveysministeriön Asumisterveysasetus 2015 antaa pienitaajuiselle melulle toimenpiderajat asuinhuoneissa. Rakennusten sisälle kantautuva äänitaso arvioitiin Turun AMK:n (Keränen, Hakala ja Hongisto, 2019) julkistamien Anojanssi-projektin tulosten mukaisen ääneneristävyysarvoin ja tuloksia verrattiin toimenpiderajoihin.

Tuulivoimaloiden välkevaikutuksia mallinnettiin WindPRO-ohjelman Shadow-moduulilla. Kaikissa välkemallinuksissa on huomioitu Joutensuon hankkeen suunnitellut tuulivoimalat (VE1 tai VE2) ja Tolpanvaaran tuulivoima-alueen rakennusluvalliset tuulivoimalat. Välkemallinuksista on lisäksi laadittu yhteisvaikutusmallinnukset, joissa on edellä mainittujen voimaloiden lisäksi huomioitu Tolpanvaaran laajennuksen tuulivoimalat. Välkemallinuksissa käytettyjen tuulivoimaloiden tiedot on esitetty taulukoissa 6–8.

Laskennassa varjot huomioidaan, kun aurinko on vähintään 3 astetta horisontin yläpuolella. Väлкеeksi lasketaan tilanne, jossa siipi peittää vähintään 20 % auringosta.

Väлкеmallin laskennassa on huomioitu hankealueen korkeustiedot, tuulivoimaloiden sijainnit, tuulivoimalan napakorkeudet ja roottorin halkaisija sekä hankealueen aikavyöhyke. Mallinnuksessa otettiin huomioon auringon asema horisontissa eri kellon- ja vuodenaikoina, pilvisuus kuukausittain eli kuinka paljon aurinko paistaa ollessaan horisontin yläpuolella sekä tuulivoimalaitosten arvioitu vuotuinen käyntiaika.

Väлкеen tarkastelukorkeutena lähialueen asuin- tai lomarakennusten pihapiirissä käytettiin 1,0 metriä ja laskentaikkunan koko oli 5,0 x 5,0 metriä. Laskentaikkunoiden suunnat asennettiin voimaloita kohti ns. "greenhouse mode".

Auringon keskimääräiset paistetunnit perustuvat Oulun lentoaseman sääaseman mitattuihin säätietoihin 1981–2010. Laskentojen tuulen suunta ja nopeusjakamana käytettiin NASA:n MERRA-dataa (Modern Era Retrospective-analysis for Research and Applications) hankealueen läheisyydestä.

Mallinnus tehtiin niin sanotulle todelliselle tilanteelle (ns. "real case", jossa huomioidaan auringonpaisteajat ja tuuliolosuhteet). Mallinnus tehtiin kahdella tavalla:

- 1) Todellinen tilanne, jossa puuston suojaava vaikutusta ei huomioitu (real case, no forest)
- 2) Todellinen tilanne, jossa puuston suojaava vaikutus on huomioitu (real case, luke forest). Puuston korkeustiedot perustuvat Luonnonvarakeskus (Luke) vuoden 2021 monilähteiseen valtakunnan metsien inventointiin (MVMI), jossa käytetään valtakunnan metsien inventoinnin (VMI) maastomittausten lisäksi satelliittikuvia ja muita tietolähteitä, kuten Maanmittauslaitoksen numeerista maastotietokantaa ja korkeusmallia.

Väлкеmallinnuksen tuloksia on havainnollistettu kartan avulla. Kartalla esitetään välkevaikutuksen (1, 8 ja 20 tuntia vuodessa) laajuus. Sen lisäksi mallinnuksessa on erikseen laskettu vaikutus tuulivoimahankealueen ympäristössä oleviin häiriintyviin kohteisiin.

2.3 Mallinnusten laskentapisteet

Melumallinnuksen, pienitaajuisen melun mallinnuksen ja välkemallinnuksen laskentapisteet perustuvat maanmittauslaitoksen maastotietokannan rakennuskantaa koskeviin tietoihin, joista selviää rakennusten käyttötarkoitus kuten asuin- ja lomarakennukset.

Hankealueella sijaitsee Maanmittauslaitoksen maastotietokannan mukaan yksittäinen lomarakennus, joka on kaupungilta saatujen tietojen mukaan muussa kuin lomarakennuskäytössä. Samoin alle kahden kilometrin etäisyydelle suunnitelluista voimaloista, niiden länsipuolelle sijoittuva lomarakennus on kaupungilta saatujen tietojen mukaan muussa kuin lomarakennuskäytössä. Näin ollen näitä kahta kohdetta ei ole huomioitu mallinnusten laskentapisteinä ja ne on merkitty karttoihin vihreillä neliöillä.

2.4 Raja- ja ohjearvot

2.4.1 Melu

Valtioneuvoston asetuksessa (1107/2015) tuulivoimaloille on määritelty suunnitteluvarot päivä- ja yöajan keskiäänitasojen maksimiarvolle. Jos tuulivoimalan melu sisältää tonaalisia, kapeakaistaisia tai impulssimaisia komponentteja, tai se on selvästi amplitudimoduloitunut, mallinnustuloksiin tulee ohjeen mukaan lisätä viisi desibeliä ennen ohjearvoon vertaamista. Koska ohjearvo sisältää jo tyypillisen tuulivoimamelun piirteet, edellä mainitut äänenpiirteiden tulee olla tuulivoimalalle epätyypillisen voimakkaita, jotta mallinnustuloksissa täytyy huomioida viiden desibelin lisä äänitasoon.

Taulukko 9. Valtioneuvoston asetuksen mukaiset tuulivoimaloiden melutason ohjearvot (Valtioneuvoston asetus 27.8.2015).

Vaikutuskohde	Päivä (7-22)	Yö (22-7)
Pysyvä asutus	45 dB	40 dB
Loma-asutus	45 dB	40 dB
Hoitolaitokset	45 dB	40 dB
Oppilaitokset	45 dB	—
Virkistysalueet	45 dB	—
Leirintäalueet	45 dB	40 dB
Kansallispuistot	40 dB	40 dB

Sosiaali- ja terveysministeriön asetuksessa (545/2015) on annettu pienitaajuiselle melulle toimenpiderajoja. Toimenpiderajat koskevat asuinhuoneita ja ne on annettu taajuuspainotamattomina yhden tunnin keskiäänitasoina tersseittäin. Toimenpiderajat koskevat yöaikaa ja päivällä sallitaan 5 dB suuremmat arvot. Sisämelujen arviointi tehdään ainoastaan matalilla taajuuksilla, sillä rakennusten ilmajäneristys on keskimäärin parempi korkeammilla

11.3.2026

taajuuksilla. Mikäli matalataajuisen sisämelun arvot eivät ylitä Sosiaali- ja terveysministeriön asetuksen (545/2015) mukaisia toimenpiderajoja, on todennäköistä, että myös kokonaismelutaso alittaa raja-arvot.

Taulukko 10. Pienitaajuisen sisämelun tunnin keskiäänitason toimenpiderajat nukkumiseen tarkoitetuissa tiloissa.

Terssikaista Hz	20	25	31,5	40	50	63	80	100	125	160	200
Keskiäänitaso L _{Zeq} ,1h, dB	74	64	56	49	44	42	40	38	36	34	32
Edellisestä laskettu keskiäänitaso A-painotettuna L _{Aeq} ,1h, dB	24	19	17	14	14	16	18	19	20	21	21

Sosiaali- ja terveysministeriön asetuksessa (545/2015, Liite 2) on asuinhuoneistojen oleskeluun ja lepoon käytettävien asuinhuoneiden toimenpiderajaksi annettu yöajan keskiäänitasolle L_{Aeq} 30 dB. Lisäksi asetuksessa (12§) todetaan, että yöaikainen musiikkimelu tai muu vastaava mahdollisesti unihäiriötä aiheuttava melu, joka erottuu selvästi taustamelusta, ei saa ylittää 25 dB yhden tunnin keskiäänitasona L_{Aeq},1h (klo 22—7) mitattuna niissä tiloissa, jotka on tarkoitettu nukkumiseen. Valtioneuvoston asetuksen mukaisen ulkomelun ohjearvon (40 dB(A)) alittuessa, on hyvin todennäköistä, että myös sisämelun toimenpideraja alittuu, kun huomioidaan rakennusten tyypillinen äänieristys.

2.4.2 Välke

Suomessa ei ole viranomaisten antamia yleisiä määräyksiä tuulivoimaloiden muodostaman välkevaikutuksen enimmäiskestoista eikä välkkeenmuodostuksen arviointiperusteista. Ympäristöministeriön tuulivoimarakentamisen suunnitteluohjeistuksessa esitetään käytettäväksi muiden maiden suosituksia välkkeen rajoittamisesta (Ympäristöministeriö 2012 (1)).

Useissa maissa on annettu raja-arvoja tai suosituksia hyväksyttävän välkevaikutuksen määristä. Esimerkiksi Ruotsissa suositus on kahdeksan tuntia vuodessa ja 30 minuuttia päivässä.

Arvioinnissa on tarkasteltu vaikutuksia alueella, jossa varjoja tai välkettä mallinnuksen mukaisessa todellisessa tilanteessa ("real case") esiintyy vähintään kahdeksan tuntia vuodessa.

3.1.3 Pienitaajuiset melutasot

Tuulivoimaloiden tuottamien matalien äänien eli pienitaajuisen melun laskennallisia tuloksia on verrattu Sosiaali- ja terveysministeriön (STM) Asumisterveysasetuksessa (545/2015) annettuihin toimenpiderajoihin. Nämä ovat enimmäisarvoja, jotka on laadittu yöaikaiselle melulle nukkumiseen tarkoitettuihin tiloihin. Mallinuksissa on huomioitu Joutensuon hankkeen lisäksi Tolpanvaaran hankkeen rakennusluvalliset tuulivoimalat.

Sisätilojen laskennalliset tulokset on saatu huomioimalla tutkitut suomalaisen pientalon ulkovaipan ääneneristysten alalikiarvot (84 % persentiili, Anojanssi 2019). Arvioinnin epävarmuustekijäksi voidaan kuitenkin sanoa se, että yleisellä tasolla rakennusten ääneneristävyydessä on suuria yksilöllisiä eroja pienillä taajuuksilla ja sisällä vallitsevaan äänitasoon vaikuttaa merkittävästi myös huoneen mitat sekä sisustus.

11.3.2026

Taulukoissa 14 ja 15 on esitetty pienitaajuisten melun laskentatulokset. Taulukoissa näkyy toimenpiderajan alitus (negatiivinen arvo) tai ylitys (positiivinen arvo). Toimenpiderajojen ylityksiä ei aiheudu, vaan rakennusten sisätiloissa melu on enimmillään 3,8 dB alle toimenpiderajan taajuudella 63 Hz (Asuinrakennus H (Rytisuo_2) hankevaihtoehdossa 2 (VE2)). Taulukoissa on lisäksi esitetty millä taajuudella tarkasteltujen rakennusten ulkomelutaso poikkeaa eniten sisätilojen toimenpiderajasta. Pienitaajuisten melun laskentatulokset on esitetty kuvaajina liitteissä 4 ja 5.

4.1.2 Pienitaajuiset melutasot (yhteisvaikutus)

Pienitaajuinen yhteismelu ei Joutensuon hankevaihtoehdoissa 1 (VE1) tai 2 (VE2) ylitä Sosi-
aali- ja terveysministeriön toimenpiderajoja laskentapisteiden sisätiloissa. Yhteismelun mal-
linnuksessa on huomioitu Joutensuon, Tolpanvaaran ja Tolpanvaaran laajennuksen tuulivoi-
mahankkeet.

Taulukoissa 23 ja 24 on esitetty matalataajuisen melun laskentatulokset hankevaihtoeh-
doissa 1 (VE1) ja 2 (VE2). Taulukoissa esitetään toimenpiderajan alitus (negatiivinen arvo) tai
ylitys (positiivinen arvo). Rakennusten sisätiloissa melu on enimmillään 3,6 dB alle toimenpi-
derajan taajuudella 63 Hz. (Asuinrakennus H hankevaihtoehdossa 2 (VE2)) Taulukoissa on
lisäksi esitetty millä taajuudella tarkasteltujen rakennusten ulkomelutaso poikkeaa eniten si-
sätilojen toimenpiderajasta. Pienitaajuisen melun tarkemmat laskentatulokset on esitetty
kuvaajina liitteistä 13 ja 14.

A ZVI (Zones of Visual Influence) calculation is performed before flicker calculation so non visible WTG do not contribute to calculated flicker values. A WTG will be visible if it is visible from any part of the receiver window. The ZVI calculation is based on the following assumptions:
DHM: Height Contours: CONTOURLINE_Joutensuon tuulivoimahanke_0.wpo (Receptor grid resolution: 1,0 m

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

Assumptions for shadow calculations

Maximum distance for influence
 Calculate only when more than 20 % of sun is covered by the blade
 Please look in WTG table

Minimum sun height over horizon for influence 3 °
 Day step for calculation 1 days
 Time step for calculation 1 minutes

 A ZVI (Zones of Visual Influence) calculation is performed before flicker calculation so non visible WTG do not contribute to calculated flicker values. A WTG will be visible if it is visible from any part of the receiver window. The ZVI calculation is based on the following assumptions:

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

A ZVI (Zones of Visual Influence) calculation is performed before flicker calculation so non visible WTG do not contribute to calculated flicker values. A WTG will be visible if it is visible from any part of the receiver window. The ZVI calculation is based on the following assumptions:

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

Noise values in calculation:

All noise values are mean values (Lwa) (Normal)

Pure tones:

Pure tones penalty is added to total noise impact at receptors

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

Assumptions for shadow calculations

Maximum distance for influence
 Calculate only when more than 20 % of sun is covered by the blade
 Please look in WTG table

Minimum sun height over horizon for influence 3 °

 A ZVI (Zones of Visual Influence) calculation is performed before flicker calculation
 so non visible WTG do not contribute to calculated flicker values. A WTG will be
 visible if it is visible from any part of the receiver window. The ZVI calculation is
 based on the following assumptions:

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.

Total times in Receptor wise and WTG wise tables can differ, as a WTG can lead to flicker at 2 or more receptors simultaneously and/or receptors may receive flicker from 2 or more WTGs simultaneously.

The calculation of the total expected values for a given receptor assumes a weighted average directional reduction for all WTGs contributing to shadow flicker within the same day. In the case where shadow flicker from different WTGs is not concurrent within the day, the total expected time at a given receptor may deviate marginally from the individual flicker time caused by each turbine separately.
